COSE215: Theory of Computation

Lecture 2 — Deterministic Finite Automata

Hakjoo Oh 2019 Spring

A Finite Automaton is a String Recognizer

- Deterministic Finite Automata (DFA)
- Nondeterministic Finite Automata (NFA)

Deterministic Finite Automata

Definition (DFA)

A deterministic finite automaton (or DFA):

$$M = (Q, \Sigma, \delta, q_0, F)$$

where

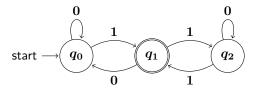

- Q: a finite set of states
- Σ : a finite set of *input symbols* (or input alphabet)
- ullet $\delta:Q imes\Sigma o Q$: a total function called *transition function*
- $ullet q_0 \in Q$: the initial state
- $F \subseteq Q$: a set of final states

Example

Definition:

$$\begin{split} M &= (\{q_0,q_1,q_2\},\{0,1\},\delta,q_0,\{q_1\}) \\ \delta(q_0,0) &= q_0, \quad \delta(q_0,1) = q_1 \\ \delta(q_1,0) &= q_0, \quad \delta(q_1,1) = q_2 \\ \delta(q_2,0) &= q_2, \quad \delta(q_2,1) = q_1 \end{split}$$

Transition graph:

Transition table:

	0	1
$ ightarrow q_0$	q_0	q_1
$*q_1$	q_0	q_2
q_2	q_2	q_1

Exercise

Design a DFA that accepts the language:

 $\{x01y \mid x \text{ and } y \text{ are any strings of } 0\text{'s and } 1\text{'s}\}$

Extended Transition Function

Extend $\delta: Q \times \Sigma \to Q$ to input *strings*:

$$\delta^*:Q imes\Sigma^* o Q$$

• (Basis) $s = \epsilon$:

$$\delta^*(q,\epsilon) = q$$

• (Induction) s = wa:

$$\delta^*(q,wa) = \delta(\delta^*(q,w),a)$$

Example

$$M = (\{q_0, q_1, q_2\}, \{0, 1\}, \delta, q_0, \{q_1\})$$

$$\delta(q_0, 0) = q_0, \quad \delta(q_0, 1) = q_1$$

$$\delta(q_1, 0) = q_0, \quad \delta(q_1, 1) = q_2$$

$$\delta(q_2, 0) = q_2, \quad \delta(q_2, 1) = q_1$$
 start q_0

•
$$\delta^*(q_0, 011) =$$

Language of Automata

Definition

A DFA $M=(Q,\Sigma,\delta,q_0,F)$ accepts a string w if

$$\delta^*(q_0,w)\in F$$

and the *language* of automaton M, denoted L(M), is defined as the set of all strings accepted by M:

$$L(M) = \{w \in \Sigma^* \mid \delta^*(q_0, w) \in F\}.$$

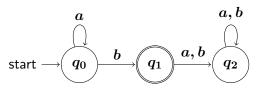

Definition

A language L is said to be $\mathit{regular}$ iff there exists some DFA M such that

$$L = L(M)$$

Exercises

What is the language of the following automaton?

2 Design a DFA that accepts the language:

$$L(M) = \{abw \mid w \in \{a,b\}^*\}$$

Oesign a DFA that accepts strings ending with 01:

$$L = \{w01 \mid w \in \{0,1\}^*\}$$
